Subj: A PROMISE KEPT - TEACHING METRIC DATA

College of Medicine Faculty:

Recall that during academic year 2011-2012, UTHSC administration informed the faculty that an "Educational Reporting Tool" was to be implemented in all UTHSC colleges and that a "Simplified Tool" was created to achieve this directive. The "Simplified Tool" was reviewed and rejected by the College of Medicine's Dean's Faculty Advisory Committee (DFAC) in January, 2013 on grounds that it inaccurately accounted for the teaching activities of COM faculty. The Dean's Faculty Advisory Council/DFAC, with permission from UTHSC administration, appointed a subcommittee to develop an alternative teaching metric to more accurately account for the various teaching venues and hours of the COM faculty.

As representatives of this latter subcommittee, we attended each of your department/division meetings during the past four months and asked you to help us to define your teaching venues and to determine the average time that you spend on a variety of educational activities. First, we thank you for your help in providing this information. We promised during those meetings that we would share with you the data obtained from this survey. This document and attachments fulfills that commitment. It consists of four parts:

- Bullet summary of observations that emanating from teaching metric data you provided
- Detailed descriptions to accompany the summary
- Actual metric with all survey data obtained from 106 faculty and a statistical analysis of it
- Histograms of representative statistical results

An excel file containing all of the raw teaching metric data will be available shortly at http://www.uthsc.edu/Medicine/DFAC/meetings.php

or by contacting the Chairperson of the Teaching Metric Subcommittee, Dr. Haavi Morreim at hmorreim@uthsc.edu.

This teaching metric and the survey data you provided were reviewed at the February DFAC meeting and forwarded to the Administration for their consideration. DFAC also approved sharing these data with you.

We much appreciate your help in generating this information, and hope that it will serve to provide a more complete and accurate description of the faculty's effort in teaching our students.

With best wishes,

On behalf of the DFAC Teaching Metric Subcommittee, Terry Cooper and Bill Pulsinelli

General observations derived from beta-testing a CoM teaching metric

Summary

- High level participation (106 submissions)
- Metric designed in sections, permitting faculty to ignore large portions of it
- Metric successfully provided detailed description of activities
- High standard deviations -- data often bi-phasic & highly skewed
- No evidence of widespread over-estimation of effort
- 75th percentile values required to avoid under-reporting faculty effort
- Administration question Tolerable level of effort under-reporting
- Method of rollout critical to success
- A UTHSC-wide one-size-fits-all metric likely to be perceived as inaccurate & unfair

Faculty Participation:

(1) 106 CoM faculty members voluntarily completed the 6 page teaching metric. The fact that submission was anonymous, i.e., no penalty for non-participation, argues metric length was not a significant deterrent to active participation. This was probably due in part to dividing the metric such that significant portions of it could be ignored.

Metric Structure:

(2) Related activities situated in sections surrounded by Heavy black boxes with color coded titles (16 font, red for Section and 14 font, blue for Subsection titles). This structure permitted faculty to ignore entire sections of activities, e.g., clinical didactic or laboratory activities, they did not perform (red titles), and subsections that were not pertinent to them, thereby effectively shortening the metric. Large, bright lettering required to diminish possibility that faculty will overlook it, read the entire metric generating negative consequences for acceptance. Keep sections to eight or fewer subsections.

Metric Data Characteristics:

(3) The metric successfully captured a detailed description of the UTHSC CoM educational enterprise.

(4) The data set did not appear to suffer from excessive over-reporting of effort as internal consistencies were observed, for example, ratio of "new" to "major revision" to "repeat" activities was relatively constant across categories.

(5) High standard deviations in the data set demonstrate broad differences in didactic activities conducted in pursuit of different objectives, in different courses, settings, and departments.

(6) In most cases the data are either highly bi-phasic and/or heavily skewed. Therefore, using means and/or medians is not representative of the whole as it misreports significant fractions of faculty efforts (see graphic examples below).

(7) The 75 percentile value, which accounts for 75% of the faculty efforts reported, is more representative than the mean or median of the values submitted due to the bi-phasic and skewed nature of the data (see graphic examples below).

(8) A critical question to be addressed is what percentile of the faculty effort estimates can be ignored before the metric would be objectively considered an inaccurate evaluation.

Future Expectations and Lessons:

(9) The clinical section of the teaching metric (Section 8) is still in need of further refinement before it adequately and unambiguously describes clinical didactic activities. As such, it is not ready for college-wide testing in its present form.

(10) Ultimate potential is seldom realized in the first iteration of a metric. Cumulative data in future years can be expected to increase the metric's accuracy in accounting for faculty effort.

(11) Method of rollout was critical to success in gathering these data. Personal meetings with each department provided opportunity to turn skepticism into demonstrated interest and then support for the effort. An impersonal email directive may achieve compliance, but not acceptance. Accountability is not optional, but time and effort spent in explaining the need for and methods to be used in achieving that accountability at the individual departmental levels will not be wasted.

(12) The enormous variability observed in this single college beta-test of a metric directly speaks to the issue of University-wide metrics and the potential for failure in attempting to adopt a one-size-fits-all approach that accurately, credibly and equitably accounts for faculty effort.

Key to metric data below

N = number of observations submitted for analysis of the individual question

Mean or Average of the submitted values

Std. Dev. = Standard Deviation

Median = Calculated value that accounts for the 50^{th} percentile of the values submitted

Min. = Minimum value submitted for the individual question

Max. = Maximum value submitted for the individual question

25% Pctl = Calculated value that accounts for bottom 25^{th} percentile of the values submitted

75% Pctl = Calculated value that accounts for 75^{th} percentile of the values submitted
