

RESEARCH 103

Session 4:

Protocol and Study Measures Training - The Importance of Accuracy and Consistency

Misty Thompson, PhD, CCRP

The Purpose of a Protocol

- ▶ Describes the objectives, design, methodology, statistical considerations and aspects related to the organization of a study
- ▶ Purpose:
 - ▶ Ensures safety of human research subjects
 - ▶ Standardization - the same data collected in the same way for all subjects. Especially important in multi-site trials or studies with multiple personnel
 - ▶ Scientific integrity
- ▶ Must be IRB approved prior to implementation

Regulations/Guidelines

- ▶ ICH GCP E6 (6)
- ▶ FDA Regulations - 21 CFR 312, 812
- ▶ NIH applicants can use a template with instructional and sample text:
 - ▶ Phase 2 or 3 clinical trials that require Investigational New Drug applications (IND) or Investigational Device Exemption (IDE) applications
 - ▶ Behavioral and social sciences research involving humans
 - ▶ <https://grants.nih.gov/policy/clinical-trials/protocol-template.htm>

Protocol Components

- ▶ General Information
- ▶ Background Information
- ▶ Trial Objectives and Purpose
- ▶ Selection and Withdrawal of Subjects
- ▶ Treatment of Subjects
- ▶ Assessment of Efficacy
- ▶ Assessment of Safety
- ▶ Statistics
- ▶ Direct Access to Source Data/Documents
- ▶ Quality Control and Quality Assurance
- ▶ Ethics
- ▶ Data Handling and Record Keeping
- ▶ Financing and Insurance
- ▶ Publication Policy

Do all studies require a written protocol?

- ▶ No treatments involved, no sponsor, no NIH funding (ex. Sample/data repositories, record review, survey studies, etc)
 - ▶ Do we need a protocol?
- ▶ Some IRBs do require a separate protocol and some may require only an application.
 - ▶ IRB application questions based on protocol components
 - ▶ Writing up a protocol beforehand will help you think through study design, feasibility, logistics, biases, etc
 - ▶ A written protocol can be distributed to all personnel to ensure consistency
- ▶ Data from these types of studies may lay groundwork for other NIH-funded studies or be apart of an FDA application later
- ▶ May not be super elaborate!

Protocol Components

- ▶ **General Information**
- ▶ **Background Information**
- ▶ **Trial Objectives and Purpose**
- ▶ **Selection and Withdrawal of Subjects**
- ▶ **Treatment of Subjects**
- ▶ **Assessment of Efficacy**
- ▶ **Assessment of Safety**
- ▶ **Statistics**
- ▶ **Direct Access to Source Data/Documents**
- ▶ **Quality Control and Quality Assurance**
- ▶ **Ethics**
- ▶ **Data Handling and Record Keeping**
- ▶ **Financing and Insurance**
- ▶ **Publication Policy**

Feasibility

- ▶ Some things to consider:
 - ▶ How many staff members/investigators are needed?
 - ▶ Can all procedures be performed in one location?
 - ▶ Target patient population and enrollment number
 - ▶ Competing studies or too many studies being conducted simultaneously
 - ▶ Do you have access to all necessary equipment and resources?
 - ▶ Do you have adequate storage facilities for investigational product, supplies, and research records?
 - ▶ Length of a study

Feasibility

- ▶ Sponsored studies have site qualifications and initiation visits
 - ▶ Good time to discuss concerns about the protocol and/or feasibility issues
 - ▶ Investigators/sites may feel apprehensive about expressing concerns or declining a study
 - ▶ Will we be selected again if we decline this study?
 - ▶ Will expressing my concerns affect my relationship with the sponsor?

Difference between precision and accuracy

- ▶ Precision - measurement of the repeatability, or consistency, of a measurement.
- ▶ Accuracy - closeness of the measurements to a specific value
- ▶ Bullseye analogy:
 - ▶ Protocol is the bullseye

High Accuracy, High Precision

- ▶ Protocol followed for all subjects enrolled
- ▶ Same data points collected the same way for all subjects
- ▶ Does NOT mean that the outcomes and results will be as expected or favorable

High Accuracy, Low Precision

- ▶ Protocol followed for most subjects
- ▶ Maybe a few minor protocol deviations
- ▶ Expected part of the study due to unavoidable circumstances
- ▶ Data integrity maintained overall

Low Accuracy, High Precision

- ▶ Protocol is not followed, but consistent across subjects
- ▶ May be due to lack of understanding of the protocol, artifact of equipment
- ▶ Data integrity may or may not be compromised, depending on the nature of the deviations
 - ▶ Inclusion/exclusion criteria not met would be a major issue
 - ▶ Equipment errors may be major or minor

Low Accuracy, Low Precision

- ▶ Protocol is not followed, not consistent across subjects
- ▶ Could not make an inference from this data
- ▶ Major protocol deviations could potentially cause harm to the subjects

Protocol Deviations/Violations

- ▶ Protocol may outline how protocol deviations are going to be handled
- ▶ All deviations should be documented
- ▶ No universal definition for major vs minor. Usually determined by sponsor/IRB definitions.
 - ▶ Could it have caused harm to a subject?
 - ▶ Non-compliance of federal regulations?
 - ▶ Compromised data integrity?
 - ▶ Multiple minor deviations may culminate in a major violation if it compromises data integrity

Protocol Deviations/Violations

- ▶ May be immediately reportable to the sponsor and/or IRB depending on the nature of the violations and sponsor/IRB policies
 - ▶ May be reportable to FDA/OHRP
- ▶ Recurring protocol deviations
 - ▶ May require re-training of staff
 - ▶ Develop a corrective action plan
 - ▶ may mean that an amendment is needed

Protocol Amendments

- ▶ Amendment - a change to some aspect of the study
 - ▶ May be minor (e.g. administrative changes) or major (e.g. inclusion/exclusion criteria, extra visits, additional specimen collection etc)
- ▶ Must be IRB-approved prior to implementation
- ▶ If FDA-regulated product involved, also submit to FDA prior to implementation
- ▶ Amendments may change the risk/benefit ratio
 - ▶ May change approval categories under the federal regulations
 - ▶ May change IRB review status (expedited vs full board)
- ▶ Ensure all study staff and investigators are trained to new protocol to avoid protocol deviations!

Amendments to the consent form

- ▶ Protocol changes may require changes to the consent form language which should also be IRB approved
- ▶ Should subjects be re-consented?
 - ▶ Sponsors/IRBs have policies about re-consenting
 - ▶ General rule of thumb: Could it change their willingness to participate?
 - ▶ Modified procedures, study design
 - ▶ Updates to safety information or confidentiality
 - ▶ What about people who have completed the study?
 - ▶ Should be notified of changes in safety profile or changes to the way their information/specimens are being stored or utilized
 - ▶ May be in the form of an addendum or letter

Changes to study operations

- ▶ Changes to site/institutional operations may not result in a change in study protocol, but may need to be IRB/sponsor approved if it changes the way you execute that protocol
 - ▶ Examples
 - ▶ Updates to site staff/investigators, updates to investigators status at a the institution
 - ▶ Updates to the delegation of authority log
 - ▶ Updates to financial disclosures
 - ▶ Changes to site location
 - ▶ Changes to storage/administration of investigational product
 - ▶ Alterations to the consent process

Changes to the clinical research landscape during COVID-19

- ▶ Sponsors and institutions were faced with tough decisions
- ▶ FDA Guidance document
<https://www.fda.gov/regulatory-information/search-fda-guidance-documents/fda-guidance-conduct-clinical-trials-medical-products-during-covid-19-public-health-emergency>
- ▶ Overall message: there is no universal answer for every study, every institution, and every patient.
- ▶ Revise study protocols and institutional policies as necessary to:
 - ▶ Protect patients
 - ▶ Maintain data integrity
 - ▶ Minimize protocol violations

Enrollment

- ▶ Do we continue to enroll, and if so, which ones?

Decision	Pros and Cons
Institutional suspension of all studies	<ul style="list-style-type: none">• Pro: Allowed for focus on COVID• Con: Patients had less treatment options
Institutional suspension of “non-essential” studies	<ul style="list-style-type: none">• Pro: Some drug/device studies could still enroll• Con: non-COVID PI-initiated studies suffered
Sponsor suspension of a study at all sites	<ul style="list-style-type: none">• Pro: keeps all sites on the same level• Con: Sites may not find it fair, cost of maintaining study with no enrollments, extends length of study

Enrollment

- ▶ Some sites chose not to limit enrollment, but still saw reductions in study participation
 - ▶ Reductions in patients going to the doctor or seeking treatment
 - ▶ Restrictions on which procedures could be conducted and patients coming in for routine visits
- ▶ Studies that were close to enrollment goal before COVID closed enrollment early if statistical analyses could be made with current subjects.

Obtaining Consent

- ▶ Major challenge: staff not allowed on site or not allowed into restricted areas such as patient hospital rooms
 - ▶ e-consent
 - ▶ Telephone consent or use of a video conference call
- ▶ Sponsors/IRBs have specific policies about how this should be executed
- ▶ Federal regulations still apply!
- ▶ May require 21 CFR part 11-compliant systems

Treatments/Interventions

- ▶ Do we continue treatment, and if so, which ones?
- ▶ Do we change administration or study operations?
- ▶ Many patients did not feel comfortable going to clinic/hospital
- ▶ Discontinue treatment/intervention:
 - ▶ Is it safe? Follow-up safety visits likely needed
 - ▶ Can they get this treatment/intervention outside of the study?
- ▶ Continue treatment/intervention:
 - ▶ How do they receive the product?
 - ▶ Logistics: On site vs delivery to home or other location
 - ▶ With delivery, other things to consider like who's there to receive it, compliance, destruction, etc.

Treatments/Interventions

- ▶ Treatments/interventions that require on-site administration (e.g. infusions or non-portable devices)
 - ▶ Collaborating with another site who don't have as many restrictions may be an option
- ▶ Any change to the administration/utilization of these treatments would require a protocol amendment and IRB/sponsor approval

Study Visits

- ▶ Aside from receiving treatment, what about follow-up visits and other study procedures?
 - ▶ Most advised to conduct telehealth/telephone visits whenever possible
 - ▶ Labs, diagnostics, physical/neurological exams, other measurements more challenging
 - ▶ Collaborations with centers with less restrictions may be an option
- ▶ Would require Amendment/IRB approval

Monitoring

- ▶ Most institutions did not allow outside visitors
- ▶ Many sponsors suspended travel
- ▶ Remote monitoring challenges:
 - ▶ Limited/no access to medical records and study records
 - ▶ Staff not available or working from home
- ▶ Monitoring visits postponed or done out of window
 - ▶ Risk-based monitoring
- ▶ IT departments changed policies as time went on

Data and Documentation

- ▶ Expecting more protocol violations during this time
- ▶ Expecting more variability in data
- ▶ Any missed visits or incomplete data due to the pandemic should be documented in the research records.
- ▶ Changing methods or when amendments implemented should also be well documented
- ▶ May need to revise statistical plan or data analysis

Research Outlook - A new normal?

- ▶ A shift towards more and more electronic records and less paper
 - ▶ e-consent, e-regulatory, electronic systems
 - ▶ Becoming more secure
 - ▶ More systems offering part 11 compliant options
- ▶ Monitoring may be more of a hybrid of on site and remote
- ▶ Telephone/telehealth visits routinely part of protocols
- ▶ Protocols designed with more flexibility
